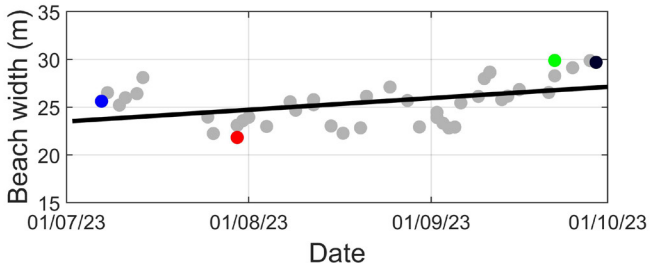
Shoreline Mapping
Last Quarter

The figure below shows the shoreline and beach width changes at Warilla Seawall from July 2023 to September 2023

Shorelines are mapped using photos taken near the mid-tide level. To calculate comparable beach widths, shorelines are adjusted to the mid-tide level using the beach slope.

Beach widths are calculated by the distance from the shoreline (corrected for tidal effects within the tidal tolerance) to fixed landward benchmarks along the beach. Reported beach widths refer to alongshore-averaged values over the shoreline mapping region.



Beach width trend
+14.41 metres/year

CoastSnap
community beach monitoring

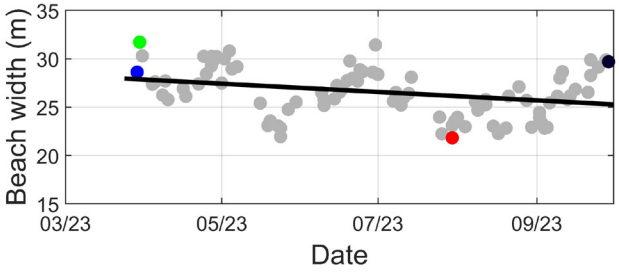
Note: the beach width trend shown in the figure refers to short-term trends over the reporting period only. This should not be used for long-term beach change analysis.

Shoreline Mapping
Last Quarter

The figures below show the shorelines and images corresponding the maximum and minimum beach width over the reporting period.

Shoreline Mapping
Since Installation

The figure below shows the shoreline and beach width changes at Warilla Seawall since the station was installed and shoreline mapping commenced.



Beach width trend
-5.12 metres/year
